TUNING Macro definition: // this is a kind of command line/batch tuning macro. Each line has to be executed on the host system. // %1 is a command line argument (only one), %2 is a number, %3 is a string, %4 is a number and %5 is a string #define TUNING(%1,%2,%3,%4,%5) do{ %1 %5; %2 %4; }while(0) // this macro does the same thing as above but additionally it returns %1, %2 and %3 (for debugging purposes) #define TUNING_RET(%1,%2,%3) do{ %1,%2,%3; }while(0) // this macro calls the above macro with the parameters in a list. So the user may call the macro for example with only 1 parameter. #define TUNING_LIST(%1) do{ TUNING_RET(%1); }while(0) // this macro calls the above macro with the parameters in a list. So the user may call the macro for example with only 1 parameter. #define TUNING_VAR(%1,%2,%3,%4) do{ %1 %5; %2 %4; }while(0) // this macro calls the above macro with the parameters in a list. Requirements: AMD APP KernelAnalyzer requires a 64-bit processor and AMD Radeon GPU. It does not support non-AMD Radeon GPUs. AMD APP KernelAnalyzer is released under the GNU General Public License version 2. Building: Compiling AMD APP KernelAnalyzer in Debug mode requires Visual C++. Please download the latest version from or use the latest version from the following MSDN download page: To build AMD APP KernelAnalyzer in Debug mode: 1. Download the package 2. Install Visual C++. 3. Run the command `cd "C:\Program Files (x86)\AMD APP\KernelAnalyzer" nmake debug` Command-Line Mode: KernelAnalyzer is an interactive kernel analyzer. To analyze OpenCL kernels from command-line mode, you can use the `-t OpenCL` option. For example: `KernelAnalyzer -t OpenCL` The name of the OpenCL kernel being analyzed can be specified with the `-k` option. To analyze a Brook+ (directX) kernel, you can use the `-t Brook+` option. For example: `KernelAnalyzer -t Brook+` To analyze an IL (OpenCL) kernel, you can use the `-t IL` option. For example: `KernelAnalyzer -t IL` KernelAnalyzer will run the kernel on the GPU, and then analyze the GPU's performance. If you wish to run the OpenCL kernel on the CPU, and then analyze its performance, you can use the `-t CPU` option. For example: `KernelAnalyzer -t CPU` To run a real-time/shader trace you can use the `-rt` option. For example: `KernelAnaly`
